What causes type 2 diabetes?

Type 2 diabetes causes Type 2 diabetes is high blood sugar levels caused by a lack of a hormone called insulin. Either your body isn't making enough or the insulin it makes doesn't work properly. This is sometimes called insulin resistance . Lack of insulin causes glucose from what you eat or drink to build up in your blood. So you may get symptoms of type 2 diabetes . If you have enough insulin or it is working properly, the glucose in your blood should be released into your cells to give you energy. If you do not have enough insulin - or the insulin your body produces is not working properly — the glucose in your blood cannot enter your cells and give you energy. And your blood sugar levels keep rising. We understand that being diagnosed with type 2 diabetes can be shocking and overwhelming, and we're here for you. We can offer you all the information, practical tips and guidance you need in bite sized blocks through our email support journey. There are a variety of factors which can increase your risk of developing type 2 diabetes. We call them the risk factors of type 2 diabetes. Some of these risk factors are: Living with obesity or overweight. Your waist measurement is unhealthy for your gender or ethnicity. Too much fat stored in or around your liver and pancreas – which can affect people of a healthy weight as well as people living with obesity or overweight. high blood pressure age ethnicity. family history. Some of these are things you can't change, like your age (your risk goes up as you get older), your ethnicity (people from African Caribbean, Black African or South Asian backgrounds are at higher risk – and from a younger age), and if family members have type 2 diabetes. But there are some risk factors that you may be able to change, like your weight or waist size . If you live with obesity or overweight, it's harder for your body to manage the levels of sugar in your blood, and having a high waist measurement means you're more at risk of insulin resis
