Clinical Guidance for Diabetes

Key points

Health care providers play a crucial role in helping patients prevent or delay type 2 diabetes and manage all types of diabetes.

They are often the first line in screening and referring patients to a type 2 diabetes prevention program or diabetes self-management education and support services.

Preventing type 2 diabetes

About 1 in 3 American adults has prediabetes, which increases their risk for developing type 2 diabetes. More than 8 in 10 of them don't know they have prediabetes.

National Diabetes Prevention Program

As a health care provider, you're often the first line in screening and referring patients to a type 2 diabetes prevention program.

Refer your patients with prediabetes to the CDC-led

National Diabetes Prevention Program

(National DPP) lifestyle change program. Research shows that the program can cut the risk of type 2 diabetes by more than half.

This yearlong program, delivered by a trained Lifestyle Coach, will teach your patients how to eat healthy, increase physical activity, manage stress, and stay motivated. They can also lower their risk of a heart attack or stroke and improve their overall health.

Managing diabetes

Diabetes Standards of Care

Stay up to date on the latest

Diabetes Standards of Care

to ensure your patients are receiving timely, equitable, and high-quality care. These guidelines include screenings and management for diabetes and related complications, such as cardiovascular disease and chronic kidney disease.

Team care

Your patients manage their diabetes care with regular guidance and support from their health care team. At every health care visit, you and other care team members can encourage them to take the steps needed to manage their diabetes effectively:

Promoting Ear Health for People With Diabetes

Promoting Eye Health for People With Diabetes

Promoting Foot Health for People With Diabetes

Promoting Medication Management for People With Diabetes

Danh mục: general

Promoting Oral Health for People With Diabetes

As a health care provider, you know firsthand that these actions are key to preventing complications and enhancing quality of life for people with diabetes. Living successfully with diabetes means developing the skills to self-manage outside the clinical setting.

Diabetes self-management education and support (DSMES)

helps people learn practical skills and personalized strategies to manage diabetes in their everyday life. DSMES provides structured support so people with diabetes can make sustainable lifestyle changes with the help of a diabetes care and education specialist. People who participate in DSMES are more likely to have better health outcomes, including lower A1C levels and fewer complications.

Diabetes education helps you and your patients^a

DSMES improves your patients' diabetes management skills and health outcomes. But less than 7% of patients participate within the first year of diagnosis. Health care providers like you are the best way to increase access to DSMES.
