Gestational diabetes symptoms

What's on this page? What are gestational diabetes symptoms? How do I know if I have gestational diabetes? What causes gestational diabetes? What happens to the baby if you have gestational diabetes? At what week does gestational diabetes develop? Gestational diabetes is a type of diabetes that develops during pregnancy. It affects women who haven't already got a diagnosis of another type of diabetes. It usually goes away again after giving birth. What are gestational diabetes symptoms? Signs and symptoms associated with gestational diabetes include: Going for a wee a lot, especially at night Being really thirsty Feeling more tired than usual Genital itching or thrush Blurred eyesight. You may have been shocked to find out that you have gestational diabetes — many women have no noticeable symptoms. As some gestational diabetes symptoms are like symptoms experienced in pregnancy anyway — like feeling more tired or going to the toilet more — most cases are diagnosed during screening for gestational diabetes. This is called an Oral Glucose Tolerance Test, also known as an OGTT. The OGTT is usually done when you're between 24-28 weeks pregnant. If you've had gestational diabetes before, you'll be offered the OGTT or self-monitoring of your blood sugar levels at home early in your pregnancy. You'll be shown how to do this and given a blood monitoring kit. Find out more about gestational diabetes tests . How do I know if I have gestational diabetes? If you develop any of the symptoms listed above, they could be a sign that you have gestational diabetes. You should talk to your midwife or GP about this as it's important that gestational diabetes is picked up as early as possible. What causes gestational diabetes? Lots of changes happen to your body during pregnancy. Along with the physical signs, the hormones you produce can make it hard for your body to use insulin properly. This puts you at a
